The User
User profile and Human Information Processing Systems

www.id-book.com

Human-Computer Interaction   **Beatriz Sousa Santos, Paulo Dias 2023**
Outline

- Users Profile – relevant characteristics for interactive systems

- Human Information Processing System (HIPS)
  - Perceptual sub system
  - Senses
    - Sight, Hearing, Touch, Smell, Taste
      + Proprioception, Kinesthesia …

  - Cognitive sub-system
  - Memory

- Some implications on the design of interactive systems

Users' profile

- Human Information Processing System (HIPS)

- Knowledge and experience

- Work and task

More variable among users

- Physical characteristics

- Environment

- Tools

There are many user models to be used in the design of Interactive systems (e.g. personas, GOMS, KLM, …)

Dialog in an interactive system

respond   read-scan

Perceptual sub-system

8

Human Information Processing System (HIPS)

- Humans have different capabilities that might be considered when designing interactive systems

- Information is received through various I/O channels

- Information is stored in memory

- Emotions may influence capabilities

- Users share common characteristics but differences cannot be ignored

Human Information Processing System (HIPS):
main aspects relevant to interactive systems design

Perceptual sub-system

memory – perceptual buffer (iconic, echoic, …)
process – pattern recognition

Cognitive sub-system

memory -

short term/working memory (STM)

long term memory (LTM)

HIPS bottleneck

processes -

selective attention
problem resolution
learning
…

Motor sub-system

Perceptual sub-system – I/O

VISION HEARING TOUCH

SMELL TASTE

The five Aristotelian senses

- Input: 5+ senses

  Sense is a physiological capacity

  of organisms that provides data

  for perception

  – Some more relevant than other

  – For HCI, vision is preferred,

    but hearing and touch are more and more important …

- Proprioception (more important in some types of systems: Virtual reality)

- Output: communication system

  – vocal, gestures, eye gaze, ,…
Why vision is preferred
Bandwidth of our senses proposed by Danish Physicist - Tor Nørretranders

we are aware of only 0.7% of reality

Vision

- Relevant for HCI:

  – Compensation of movements and illumination changes

  – Context used to solve ambiguities

  – May be tricked: Visual illusions come from excessive compensation.

Eye – sensor

Brain - processor

(Hubel, 1988)

Pattern Recognition

Process that matches information from a stimulus with information retrieved from memory

- It is a very powerful process

- It is subconscious

- It does not use only current data

- It solves ambiguities

- Occurs also in other senses

The quick brown
fox jumps over the
the lazy dog.

(Kaniza illusion, Wikepedia)

Visual Illusions illustrate that **what we see does not depend only of the stimulus**

- bring out good adaptations of our visual system to standard viewing situations

- under artificial manipulations can cause inappropriate interpretations of the scene
Ponzo illusion

Pennrose triangle: Impossible object?

Kanizsa illusion

Necker cube
Kanizsa illusion:

Although there are no actual triangles a sort of pattern recognition phenomenon is triggered and the image is interpreted as two overlapping triangles (simple explanation)

https://en.wikipedia.org/wiki/Illusory_contours

Necker cube:

Cube with no visual cues as to its orientation; it can be interpreted to have either the lower-left or the upper-right square as its front side

https://en.wikipedia.org/wiki/Necker_cube

18
Ames Room

(what we see does not depend only of the stimulus)

A room that pushes the boundaries of human perception...

Point of view

19
Other senses

- Hearing

  - Information on direction, objects and distance

  - Only sense that is really 3D

  - Cannot be "turned off"

  - Human hearing - 20Hz to 15KHz

  - Filtering is possible (Background noise – "cocktail party" example)

Other senses

- Touch
  - Important feedback

  - Key senses for people with sight problem

  - Several receptors in skin:
    - Termoreceptors: cold and hot
    - Nociceptor: pain
    - Mecanoreceptor: pressure

  - Some areas more sensitive (fingers)

https://en.wikipedia.org/wiki/Sense

Simulators are complex interactive systems that stimulate several senses…

https://www.the737experience.co.uk/

https://surgicalscience.com/systems/lapsim/

https://en.wikipedia.org/wiki/Flight_simulator

Other senses

- Smell and Taste

    - Complex chemical senses

    - High latency

    - Difficult to use in HCI

    - Some experimental work exists (and some commercial products)

- And others (as proprioception - awareness of your body position)

https://en.wikipedia.org/wiki/Sense

https://www.khanacademy.org/test-prep/mcat/processing-the-environment/somatosensation/v/proprioception-kinesthesia
https://neuro-marseille.org/en/blog/our-true-sixth-sense-on-arte/
Memory

The **Atkinson–Shiffrin model** (1968) (a.k.a. multi-store model or modal model) asserts that human memory has three components:

- Sensory memory

- Short-term memory -> working memory (more recent concept)

- Long-term memory
How we make memories - Crash Course Psychology #13

https://www.youtube.com/watch?v=bSycdIx-C48

How we remember and forget - Crash Course Psychology #14

https://www.youtube.com/watch?v=HVWbrNls-Kw

Memory

- The Atkinson–Shiffrin model (1968) memory has three components
  - Sensory memory / iconic memory, very short
    - A few seconds
  - Short-term memory / working memory
    - +/- 18 seconds, 7+/-2 items
  - Long-term memory
    - ~Infinite capacity
Short Term Memory (STM) / Working memory

- Working memory:
  - Mental calculus (6*35)
  - Reading (understand a sentence)
  - …
- Characteristics:
  - Quick access +/- 70ms
  - Quick forget
  - Limited capacity 7 +/- 2

  - Can be increased with chunking, to enter long-term memory

Short Term Memory (STM) / Working memory

a few characteristics:

- Short duration: a few seconds (<30s)

- Limited capacity: 7$\pm$2 elements

what is an element?

example: try to memorize the following numbers   649325401741
                                                                                111122223333

              which is easier?

              and this one: 351234370517

Short Term/ working Memory (STM)

649325401741 $\longrightarrow$ 12 digits

111122223333 $\longrightarrow$ 3 digits and a rule

234370200   351 234 370 517

Portugal Aveiro   University area   IEETA building

These numbers correspond to different "chunks"

Chunk: the largest meaningful unit that a person recognizes; depends on the person knowledge

- Chunking refers to an approach for making more efficient use of short-term memory by grouping information

- Resulting chunks are easier to commit to memory than a longer uninterrupted string of information.

- Can be used for making more efficient use of short-term memory by grouping information

GEORGE MILLER AND THE MAGIC NUMBER SEVEN

Short-term memory can hold 7 ± 2 (5 to 9) **chunks** or **bits** of information
Long Term Memory

Stage of the dual memory model (Atkinson-Shiffrin memory model) informative knowledge can be stored for long periods of time

Main characteristics:

- "Infinite" capacity and duration

- non reliable access

http://study.com/academy/lesson/long-term-memory-definition-types-examples.html
Long-term Memory - Recognition vs. Recall

- Information retrieval - Recognition vs. Recall
  - Recognition: remembering with the help of a visible cue
    - aka "Knowledge in the world"
  - Recall: remembering with no help
    - aka "Knowledge in the head"

- Recognition is much easier
  - so e.g. menus are more learnable than command languages

Design Implications

Memory

- Reduce cognitive load by avoiding long and complicated procedures for carrying out tasks.

- Design interfaces that promote recognition rather than recall by using familiar interaction patterns, menus, icons, and consistently placed objects.

- Provide users with a variety of ways of labeling digital information (e.g. files, emails, and images) to help them easily identify it again through the use of folders, categories, color, tagging, time stamping, and icons.

Selective attention

Occurs when we block out certain features of our environment and focus on one particular feature

It may be:

- Voluntary

- Involuntary

Both can be (and are) exploited in UIs

Calling your attention to an application

https://dictionary.apa.org/selective-attention
https://www.khanacademy.org/test-prep/mcat/processing-the-environment/attention-language/v/selective-attention
Design Implications

Attention

- Consider context. Make information salient when it requires attention at a given stage of a task.

- Avoid cluttering visual interfaces with too much information.

- Consider designing different ways of supporting effective switching and returning to a particular interface.

Design Implications

Learning

Design interfaces that encourage exploration

Design interfaces that constrain and guide users to select appropriate actions when initially learning.

Design Implications

Problem solving

- Provide information and help pages that are easy to access for people who want to understand more about how to carry out an activity more effectively (e.g., web searching).

- Use simple and memorable functions to support rapid decision-making and planning.

- Enable users to set or save their own criteria or preferences

HIPS Strengths and weaknesses (*versus* computer)

Strengths	Weakesses
LTM ~infinite capacity	STM limited capacity
LTM duration and complexity	STM limited duration
Capacity to learn	Error prone processing
Powerful selective attention	Non reliable access to LTM
Powerful pattern recognition process	Slow processing

Recommendation:
Assign tasks between user and computer according to the capacities of each

Example: minimize the users STM load
   do not ask the user to perform computations

Emotion

- Various theories on how it works

- Involves cognitive and physical response to stimuli

- Biological response to a physical stimuli is called affect

- Affect Infuences how we react to situations

    "Negative affect can make it harder to do even easy tasks; positive affect can make it easier to do difficult tasks"

    (Donald Norman)

Not only the cognitive system is important

But also the **emotional system**
- Emotional design is a critical part of design

- Other Donald Norman videos:

  http://www.youtube.com/watch?v=Wl2LkzIkacM

  http://www.youtube.com/watch?v=_PM3uqPNrWY

  https://www.interaction-design.org/literature/book/the-encyclopedia-of-human-computer-interaction-2nd-ed/affective-computing

43

- As … moved from designing and evaluating work-oriented applications towards dealing with **leisure-oriented applications**, … we have had to consider e.g. what constitutes an *experience*, how to deal with users' ***emotions***, and understanding *aesthetic* practices and experiences"

https://www.interaction-design.org/literature/book/the-encyclopedia-of-human-computer-interaction-2nd-ed/affective-computing
44

# User Profile- other characteristics (besides HIPS)

- Experience and knowledge - education and reading level
experience with the system and task
mother language
computer literacy …

- Work and task   - usage frequency
training
usage type (mandatory, optional)
usage of other systems …

- Physical Characteristics – color vision deficiencies
physical deficiencies
handedness
age …

Don't forget cultural aspects!!...

Color blindness

Ishihara test for red-green blindness (daltonism or deuteranopia)

(Shinobu Ishihara,1917)

- The test includes 38 figures

User Profile - overview

- Human Information Processing System

- Experience and knowledge - education and reading level
  experience with the system and task
  mother language
  computer literacy …

- Work and task   - usage frequency
  training
  usage type (mandatory, optional)
  usage of other systems …

- Physical Characteristics – color vision and physical disabilities
  handedness
  age …

Don't forget Cultural aspects!!...

How do these characteristics influence UI design?

- Much system experience, but low task experience -> more semantic help

- Much task experience but low system experience -> more syntactic help

- High usage frequency -> easy to use

- Low usage frequency -> easy to learn and remember

- Mandatory -> easy to use

- Optional -> easy to learn and remember

- Color (particularly red and green) should not be used as only cue to convey information
    – Etc., …

The take away:

- Users are much different from designers/developers

- Users vary a lot among thenselves

- Users change along time (evolve, forget...)

Final recommendations:

**We should consider the users as an unknown
 species and study them scientifically**

Remember: You are not the user!

Paper presentation evaluation and voting

- Consider the TIME + the following aspects :

    - Selection of the paper:

        - is the topic understandable by this audience?

    - Slides:

        - are well organized?

        - include the needed information?

        - have the right amount of text and figures?

    - Oral presentation:

        - was fluid and enthusiastic/motivating?

        - was balanced between the two presenters?

    - Personal conclusions and discussion:

        - the personal conclusions were adequate

        - the presenters provided good answers

# Paper presentation evaluation and voting

- Voting scale on overall performance:

  5- Excellent

  4- Very good

  3- Good

  2- Fair

  1- Poor

- Presenters, please submit the slides via Moodle:

Submission of paper presentation slides (the day of your presentation)

Please submit the presentation slides just before your presentation using the following file name format:

TPX_nmec1+nmec2_presentation date;

e.g.:

TP1_120000+120001_March_1.pdf
